

## Patient Medical Report

**Date:** 17-Feb-2025

**Patient Name:** Youssef Al-Fahd

**Patient ID:** 102356

**Physician:** Dr. Layla Al-Harbi

---

### Diagnosis: Lower Limb Physical Disability (Post-Traumatic Injury)

#### Patient Symptoms & Condition:

- Limited mobility in the right leg
- Muscle weakness and imbalance
- Difficulty walking without assistance
- Occasional pain in the affected limb

#### Medical History:

The patient suffered a **fractured femur** due to a **road traffic accident six months ago**. Surgical intervention was performed, including internal fixation with metal plates. The patient has since undergone **physical rehabilitation**, but experiences persistent mobility limitations and muscle weakness in the affected limb.

#### Diagnosis & Treatment Plan:

After medical evaluation, the patient has been diagnosed with a **partial physical disability** affecting the lower limb. Treatment recommendations include:

- Continued **physical therapy** to strengthen muscles and improve range of motion
- Use of **mobility aids (crutch/cane)** as needed for support
- Pain management through **physical exercises and mild analgesics**
- Regular follow-up assessments to monitor progress

#### Prognosis & Follow-up:

The patient is expected to continue improving with **consistent physiotherapy and mobility training**. However, **permanent functional limitations** may persist, requiring long-term management.

The next evaluation is scheduled in **three months** to assess mobility progress and determine the need for further intervention.
