

Patient Medical Report

Date: 17-Feb-2025

Patient Name: Ahmed Al-Mansouri

Patient ID: 100245

Physician: Dr. Khalid Al-Rashid

Diagnosis: Upper Respiratory Infection (Common Cold / Bronchitis)

Patient Symptoms:

- Cough
- Fever (38.2°C)
- Sore throat
- Sneezing
- Mild headache

Medical History:

The patient presented with symptoms of a respiratory infection, including persistent cough, fever, and nasal congestion. Symptoms began three days ago and gradually worsened. There is no history of chronic respiratory conditions such as asthma.

Diagnosis & Treatment Plan:

Based on the clinical evaluation, the patient was diagnosed with bronchitis, likely caused by a viral infection. Treatment includes:

- Increased fluid intake and rest
- Over-the-counter fever reducers (Paracetamol)
- Cough suppressant as needed
- Monitoring for worsening symptoms such as difficulty breathing

The condition is expected to resolve within 7-10 days with proper rest and symptom management. No hospitalization is required at this time.

Prognosis & Follow-up:

The patient has been advised to return for further evaluation if symptoms persist beyond two weeks, or if severe symptoms develop, such as difficulty breathing or high fever.
